

Electric Wire Rope Hoist NOVA2

Product information

The NOVA² wire rope hoist is based on innovative materials, an advanced design, and functionally optimized components. The product development process has also focused on user-friendliness, sustainability, digitalization and control, as well as maintenance and service.

The new series offers models with lifting capacities of up to 20 tons.

Model variety – With a range of load capacities, lifting heights, speeds, features, and control options, the wire rope hoist can be scaled individually and precisely to your specific needs.

New rope angle monitoring – In addition to proven Crane Intelligence control features, we offer three new functions based on continuous sensor-based rope angle measurement. When preset limit values are exceeded, these features automatically support the operator.

In addition to the steel wire rope, the new synthetic rope offers, for the first time, additional benefits that expand and/or improve the hoist's operational capabilities.
